

Scatter plot showing VL sES (Y-axis) versus VL no stim (X-axis) for the MOp group (n=282, p=2.1e-29). The plot includes a dashed diagonal line representing the identity line (y=x). Data points are colored by group: green (VL no stim < 0.1), red (0.1 < VL no stim < 0.2), and purple (VL no stim > 0.2). Most data points are clustered near the origin, with a few outliers at higher VL sES values.

VL no stim

Scatter plot showing the relationship between distance from sES (mm) on the x-axis and $-\log_{10}(\text{p-value})$ on the y-axis. The x-axis ranges from 0 to 4 mm, and the y-axis ranges from 0 to 25. A red dashed line indicates a significance threshold at approximately $-\log_{10}(\text{p-value}) \approx 3$. Brain regions are labeled: VISp, CA1, MOp, MOs, RSPd, CL, CP, CA3, ACAv, AV, AMd, MD, ccb, SSpl, APN, cing, RSPagl, RSPAd, LP, RSP, SUB, DG, FUS, VISpm, VISa, HPT, and GP. Most regions show a positive correlation, with some regions like MOp and MOs having high $-\log_{10}(\text{p-value})$ at intermediate distances.
