

Scatter plot showing VL sES (Y-axis) versus VL no stim (X-axis) for the MOp group (n=282, p=2.1e-29). The plot includes a solid diagonal line and a dashed diagonal line. Data points are colored green, red, and purple, corresponding to different groups.

Scatter plot showing the relationship between distance from sES (mm) on the x-axis and $-\log_{10}(\text{p-value})$ on the y-axis. The x-axis ranges from 0 to 4 mm, and the y-axis ranges from 0 to 25. A red dashed line is drawn at $-\log_{10}(\text{p-value}) \approx 2.5$. The plot shows that many brain regions have a significant association with distance from sES, with the strongest associations (highest $-\log_{10}(\text{p-value})$) occurring at intermediate distances (around 1.5 to 2.5 mm). Regions labeled include MOp, MOs, CA1, VISp, RSPd, CL, DG, CP, CA3, ACAv, AV, AMd, MD, ccb, SS-II, APN, cing, RSPagl, RSPAd, LP, VISpm, VISa, and others.
